

L0 fixed depth threshold vs. L1 depth-velocity criterion, both L1 rules

All 70 scenarios of data/scenario_sweep.csv. Verdict columns read as-is; no threshold recomputed in this figure.

Bare rule, superseded

L1 = FORD when $D \times V \leq 0.60 \text{ m}^2/\text{s}$ only

30 scenarios: L1 permits, L0 refuses

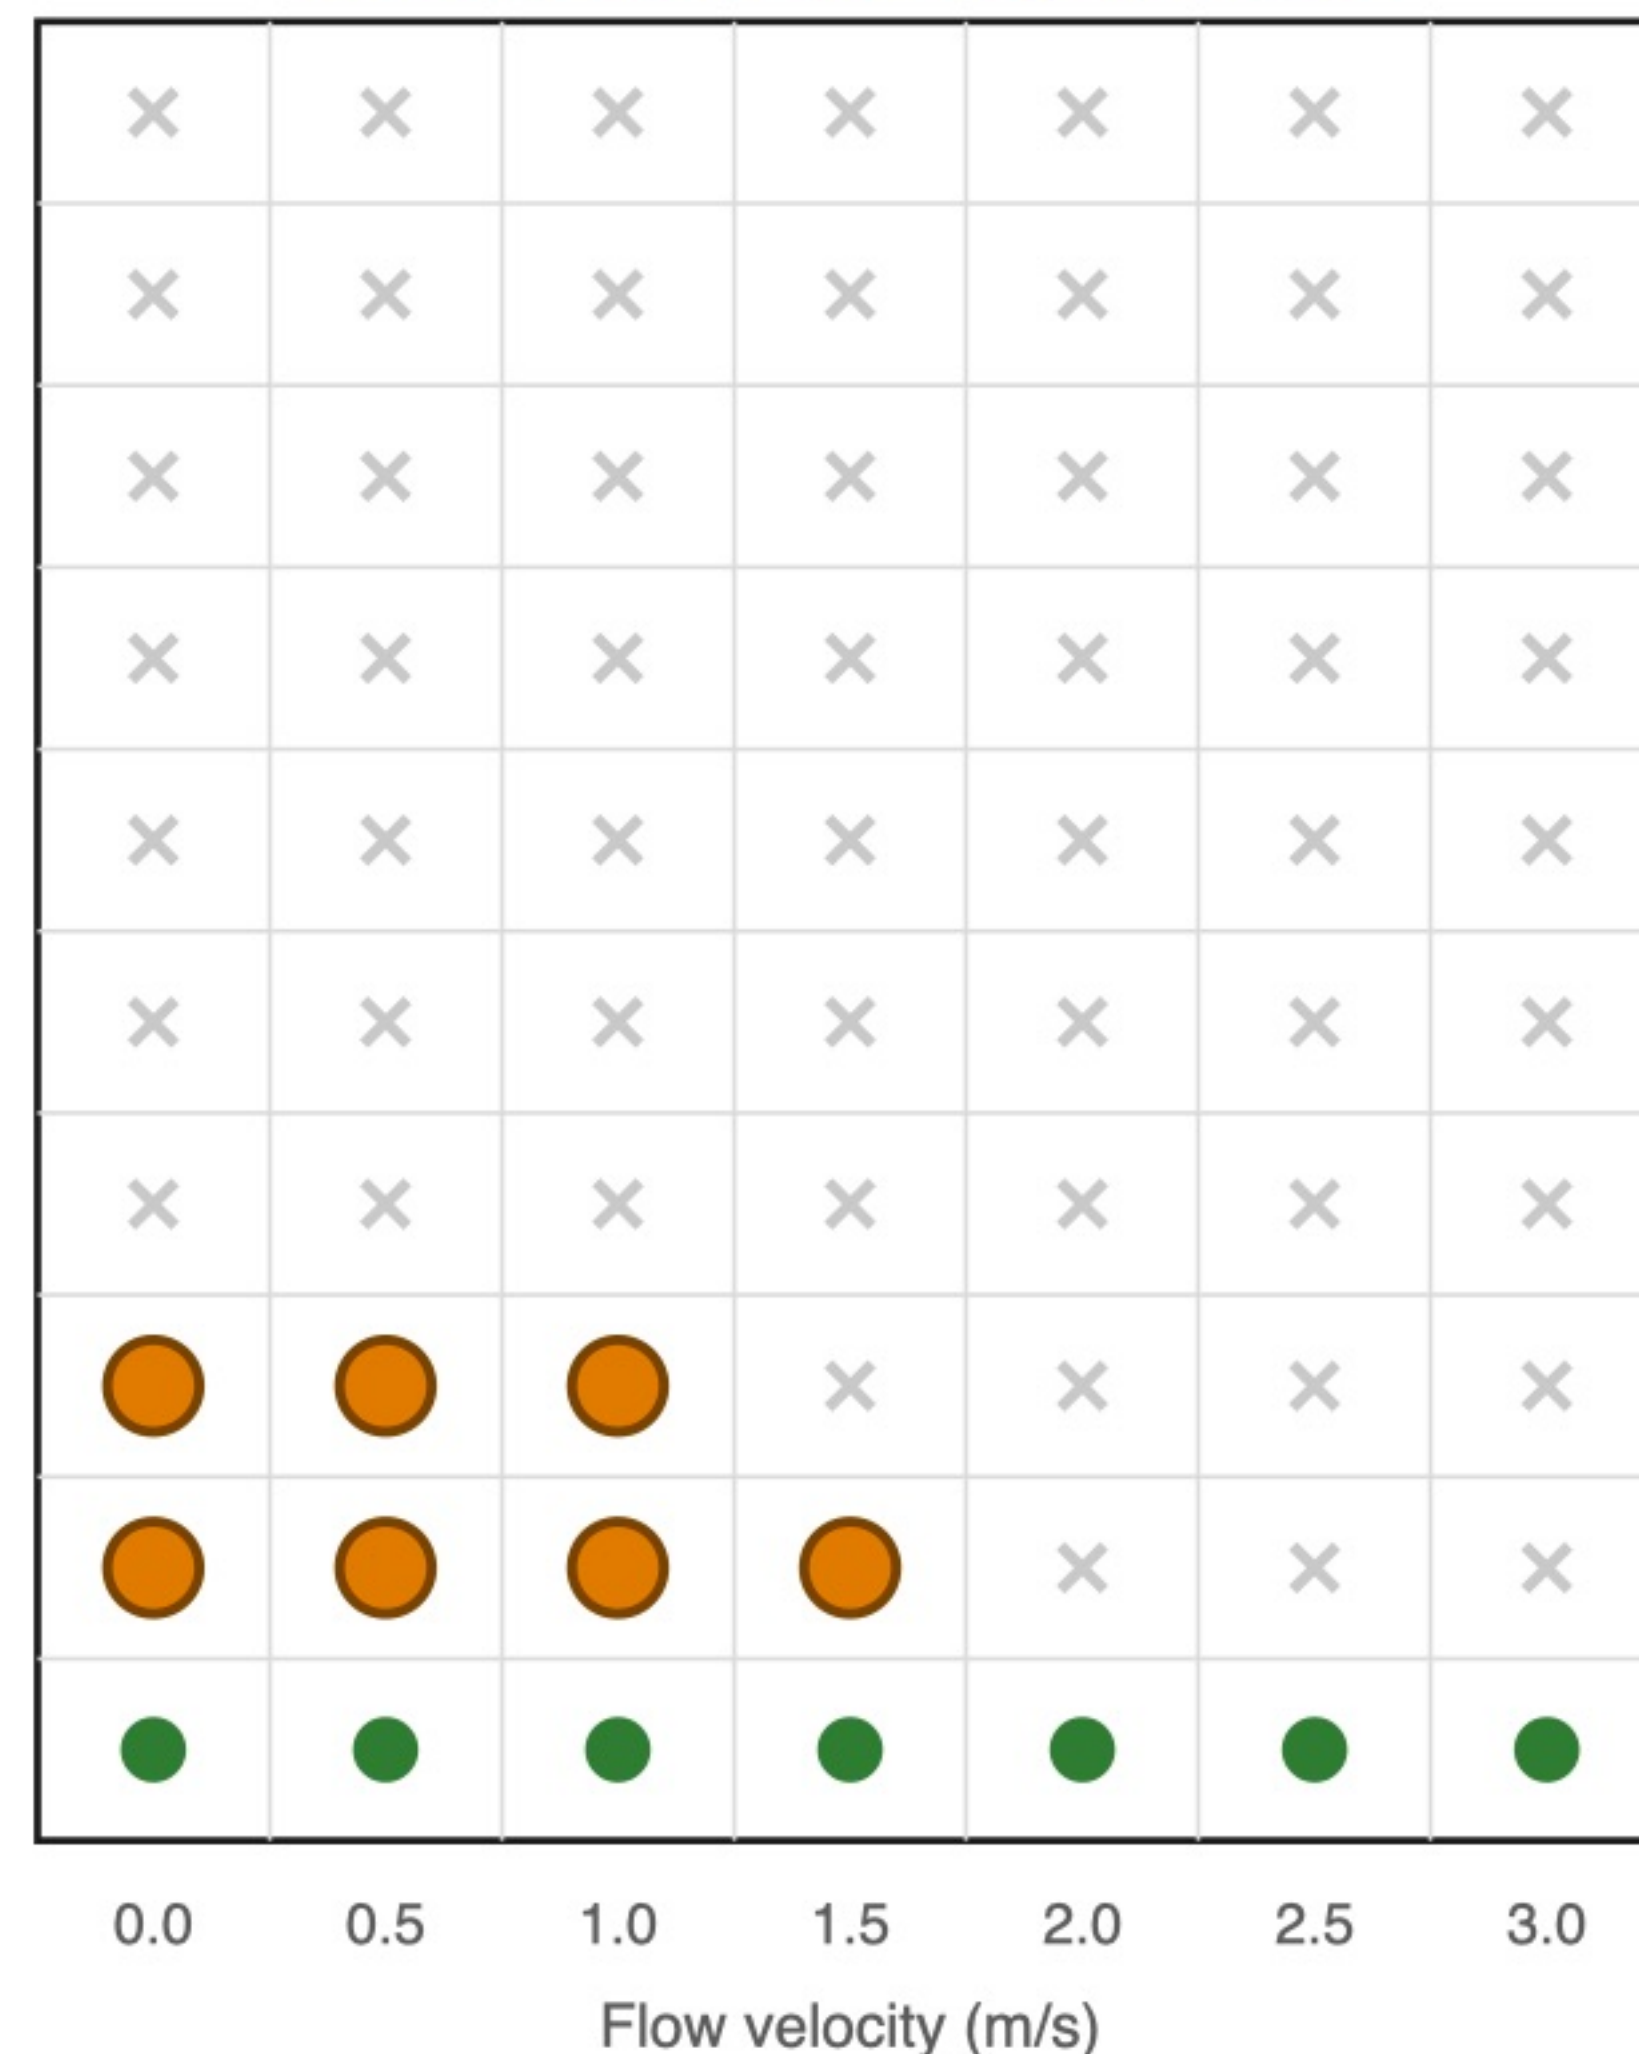

total L1 permits: 37 of 70

Joint rule, canonical

L1 = FORD when depth cap AND $D \times V$ cap both hold

7 scenarios: L1 permits, L0 refuses

total L1 permits: 14 of 70

● both permit ● L1 permits, L0 refuses × both refuse
