

G8 Coupled MPM hero still, grid 64, 1100 kg, standing water

Frame 65 of 90 from hero_g64_m1100_FIXED.mp4, the peak-displacement frame ($|d| = 0.665667$ m at $t = 2.167$ s). Rendered with the fixed PyVista path this session: the `enable_shadows` call was removed, and the water surface passes its gates at `open_edges = 0` with +1.65% volume error.

WATER VISIBILITY VERIFIED before saving: 9.25 pct of the cropped frame is viridis-mapped water surface. The previous hero shipped with zero water in all 90 frames, so this check is now mandatory and automated in `renders/yaris_render_s1/check_water_frames.py`.

Realized depth 0.2944 m (4 layers $\times$ h), 1.5 m/s surge, $D \times V$ 0.441644 m²/s, one Yaris hull at 1100 kg. Water is coloured by speed, 0 to 1.896 m/s.
