

Which L1 formula matters: bare hazard scalar vs. joint depth-and-velocity rule

All 70 scenarios of data/scenario_sweep.csv. Verdict columns read as-is; no threshold recomputed in this figure.

Bare rule (DxV only)

L1 = FORD when $DxV \leq 0.60 \text{ m}^2/\text{s}$, no depth cap

30 scenarios: L1 permits, L0 refuses

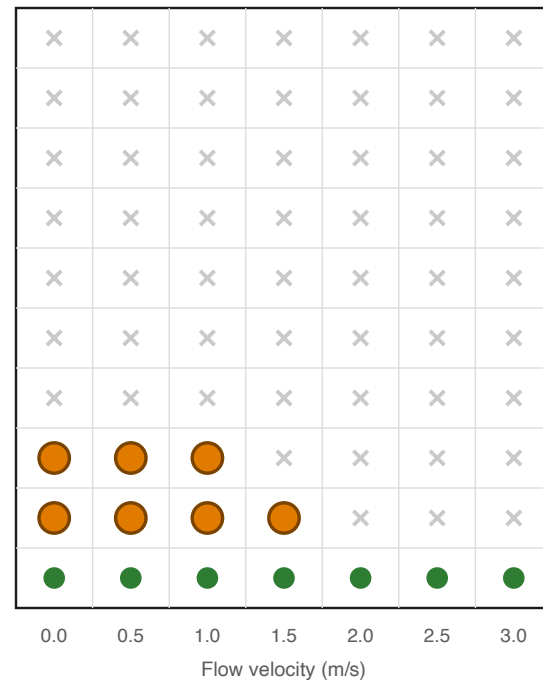

total L1 permits: 37 of 70

Joint rule (depth, velocity, and DxV)

L1 = FORD when depth $\leq 0.30 \text{ m}$ and $DxV \leq 0.30 \text{ m}^2/\text{s}$

7 scenarios: L1 permits, L0 refuses

total L1 permits: 14 of 70

L1 permits,
L0 refuses

-23
scenarios

bare joint
30 → **7**

● both permit ● L1 permits, L0 refuses x both refuse

L0 permits and L1 refuses never occurs in this dataset.
